

Overlapping End-Joint System

There's more protection with Cedar Valley Shingle panels watertight end joint!

Western Red Cedar

Used for centuries, western red cedar is one of the finest natural siding products. WRC is the first line of defense at our end joints with a .31" overlapping end. Properly nailed, it has passed ASTM E331 "Water Penetration Testing". See Cerny & Ivey Labs Report #22270-5

11/32" Doug-Fir CDX Plywood

The 1-piece solid Douglass Fir plywood backer is graded CDX and is 11/32" thick. This full backer provides a stable mounting base for the fiberglass matte and cedar shingles.

Premium Fiberglass Matte

Adding an inorganic U.V. barrier between the shingles and the plywood backer provides extra protection and durability. The fiberglass matt laminate works as an under coursing to protect the plywood against moisture intrusion between the keyways and to resist any U.V. degradation. The coated fiberglass matte is also impervious to cleaners, solvents, wood stripping solutions and paint thinners.

Real Shingles with Real Keyways

Because Cedar Valley has a fiberglass matte behind our beautiful shingles as the undercourse, we can use real tapered shingles with real shingle keyways. Any water that gets into the open keyways is shed back onto the outside of the wall.

Technical Questions or Assistance

For questions on the components of our shingle siding panel please call the factory at 1-800-521-9523 and ask for a technical rep. We're always happy to help!
